

Artist Statement

Interactions

- Orbit navigation using mouse input
- Clicking on a “dream capsule” transitions the viewer into another realm

Intentions

This project explores altered states of consciousness through an interactive 3D environment. I was particularly interested in how dreams are recalled, often not as clear images but as vague, shifting impressions. The experience feels similar to moving underwater, where visual and auditory clarity soften while intuition and tactility become more prominent.

To reflect this, I created “dream capsules,” which are organic forms that resist full comprehension. Just as the viewer begins to understand their shape, they shift and dissolve, emphasizing essence over detail. These forms are meant to feel unstable, like sand slipping through one’s fingers, suggesting the fleeting and ungraspable nature of dream imagery.

Conceptually, the project is informed by my interpretation of Buddhist thought, where consciousness exists as an interconnected network. Each individual acts as a node within a larger net of interconnected energy. This idea, combined with recurring ocean imagery in my thinking such as nets, swimming, and currents, led me to visualize the environment as a submerged network of pearl-like nodes. Each capsule contains its own dream state and is subtly connected to others through a pulsating light that travels between them. Rather than explicit connections, this moving light suggests association, rhythm, and flow between states of consciousness.

References

The project draws visual and conceptual inspiration from *Cadence* by Kior. The flowing, smoke-like forms in this work evoke a sense of layered realities and continuous transformation. They suggest both natural and synthetic phenomena, resembling kelp, vapor, or fluid currents, which resonated with my underwater and network-based visual language. The piece also carries an ethereal quality that aligns with my interest in altered perception and dream states.

Another key reference is *Inside Elsewhere* by Lauren Warrington. This work influenced the project's approach to immersive environments and transitions between realities. I was particularly drawn to the contrast between the metallic monolith and the soft pastel surroundings, as well as the moment of entering the rabbit's eye and encountering an unexpected dreamlike interior. This idea of a contained object acting as a portal directly informed the structure of the dream capsules in my project.

Implementation

The project was developed using JavaScript and Three.js. Organic motion was achieved by displacing geometry vertices using Perlin noise, creating continuously shifting forms that feel alive and unstable.

The traveling pulse of light was implemented by mapping points along a curve and animating their opacity and color over time. The pulse not only moves based on time but also shifts color.

The interaction system separates the experience into two states, an exterior and an interior world. In the exterior, the viewer navigates between capsules. When a capsule is clicked, the camera moves toward it and transitions into an interior space. Currently, this inner world is represented as a void, serving as a placeholder for future development.

Inside world void

Future Development

Moving forward, I plan to expand the environment by generating multiple dream capsules, each containing a distinct internal world. I am also interested in incorporating spatial audio such as muffled, ambient, and fluid sounds to deepen the immersive underwater atmosphere and reinforce the sensory shift between states.
